

Figure 1: Revenue per Product Category

Figure 1. Revenue per product category across all 56 orders. Electronics is by far the leading category, contributing 6,185 of the 8,298 total (75%). Home Essentials and Clothing follow at a distance, while Office Supplies and Accessories contribute small amounts.

Figure 2: Total Spending per Customer (colored by classification)

Figure 2. Total spending per customer, colored by classification (blue = high-value > \$100, orange = moderate \$50-\$100, red = low-value < \$50). The top three spenders (Emma Wilson, Grace Lee, Alice Johnson) alone account for 60% of total revenue, illustrating a clear concentration of value among a few customers.

Figure 3: Top 10 Most Frequently Purchased Products

Figure 3. Top 10 most frequently purchased products across all orders. Water Bottle leads (purchased 5 times), followed by Headphones and T-Shirt (4 times each). These repeat-purchase items are good candidates for loyalty bundles or recurring restock promotions.

Figure 4: Number of Distinct Categories Purchased per Customer

Figure 4. Number of distinct product categories purchased per customer. Every customer shops across multiple categories, and most reach 3 or 4 different categories, which supports a cross-category recommendation strategy rather than a single-category focus.

Figure 5: Customer Classification Breakdown

Figure 5. Customer classification breakdown using the spending rules defined in section 3.2 of the notebook. 7 high-value buyers, 2 moderate buyers, and 1 low-value buyer. The skew toward high-value buyers is driven mainly by the Electronics purchases visible in Figure 1.
